[CLAIM 6]

A cement-containing resin composition of Claim 1, in which 70 to 30 weight-parts of cement are mixed to 30 to 70 weight-parts of moisture hardening type resins.

[CLAIM 7]

The putty material characterized by including the cement-containing resin composition of Claim 1.

[CLAIM 8]

A putty material of Claim 7, which uses as a surface-preparation material.

[DETAILED DESCRIPTION OF INVENTION]

[0001]

[TECHNICAL FIELD]

This invention relates to a cement-containing resin composition, it is related with the putty material which further contains it.

The cement-containing resin composition and putty material of this invention show the adhesion excellent in the concrete of wet condition, it is suitably used as a surfacepreparation material of the repair work of concrete, or lining construction.

[0002]

[PRIOR ART]

Generally the resin-lining construction method is used as a construction method for protecting concrete from a corrosion property material conventionally.

If interposed between concrete surfaces by water, even if it hardens the thermosetting resin

性樹脂はコンクリート表面に水 used for a resin-lining construction method, it will not adhere on a concrete surface, or even if it adheres, only very low adhesive power is obtained.

In order to solve this, the polymer cement which mixed the Portland cement, the aggregate, and the mixing material, and the so-called moist primer which provided the hydrophilicity are used for the epoxy-resin emulsion as a surface-preparation material on the surface of concrete. However, the function which absorbs and hardens the surface moisture content of concrete does not have all in the resin itself.

[0003]

[0004]

一般に、コンクリート表面に樹 お十分接着する木分のとして、 は 6 %以 を 8 次 以下、望まる。それにさるのため、 のでは、

[0003]

On the other hand, the liquid moisture hardening type urethane resin is known as a primer which absorbs and hardens a moisture content.

However, moisture contents necessary to the own hardening of an liquid moisture hardening type urethane-resin primer are few.

It hardens, even if the surface of concrete leaks wet with water remarkably.

However, a concrete surface does not adhere, or even if it adheres, only very low adhesive power is obtained.

100041

Generally, for a resin to adhere a concrete surface sufficiently, it is necessary to make surface moisture content of concrete 8 % or less, preferably 6 % or less.

Therefore, in order to dry a concrete surface, in a job site, forced drying is carried out for a concrete surface at a heater, since it waited for concrete to dry naturally, it is the situation which the time necessary for completion cannot but continue for a long period of time.

[0005]

[0005]

【発明が解決しようとする課 題】

そこで、コンクリート表面の乾 燥が不十分な状態でも施工可能 なパテ材の開発が望まれてい た。

[0006]

[0006]

【課題を解決するための手段】 本発明者らはコンクリートの表 面水分率にかかわらず、常時安 定した接着強度が得られ、かつ 素地調整材として好適なセメン ト含有樹脂組成物およびパテ材 について鋭意検討した結果、本 発明に到達した。

[0007]

すなわち、本発明は、湿気硬化 型樹脂とセメントを含有するセ メント含有樹脂組成物、および それを含むパテ材に関する。

[0008]

【発明の実施の形態】

[Embodiment]

The moisture hardening type resin used by this invention is a resin hardened with moisture. For example, a moisture hardening type urethane resin, a moisture hardening type epoxy resin, etc. can be used, and, among them, a moisture hardening type urethane resin is desirable.

あり、例えば、湿気硬化型ウレ タン樹脂、湿気硬化型エポキシ 樹脂などが使用可能であり、な かでも湿気硬化型ウレタン樹脂

が好ましい。

[0009] さらに、その分子構造内部にウ 100091

Furthermore, the moisture hardening type

[SOLUTION OF THE INVENTION]

[PROBLEM ADDRESSED]

Present inventors

It is not concerned with the surface moisture content of concrete, but the always stabilized bonding strength is obtained, and earnestly about made examination was containing resin composition and putty material suitable as a surface-preparation material.

Then, development of the putty material which drying on the surface of concrete can construct

also in the inadequate state was desired.

Consequently, this invention was attained.

[0007]

That is, this invention relates to the cementcontaining resin composition which contains a moisture hardening type resin and a cement, and the putty material containing it.

[8000]

レア結合を有している湿気硬化 型ウレタンウレア樹脂は、ウレ タン結合のみの湿気硬化型ウレ タン樹脂に比較して耐薬品性に 優れており、より好ましい。特 に、上下水道施設では、ライニ ング工事により硫化水素や種々 の処理薬品からコンクリートを 保護する必要があり、接着性と ともに耐薬品性に優れる材料で あることが必要である。

[0010]

また、本発明で用いられる湿気 硬化型樹脂は、作業性などの点 で、一液型湿気硬化型樹脂であ ることが好ましい。

[0011]

本発明で用いられるセメント は、特に限定されないが、例え ば、通常コンクリート工事に一 般的に用いられるポルトランド セメント、高炉セメント、シリ カセメント、フライアッシュセ メントが挙げられ、好ましくは、 ポルトランドセメントが使用さ れる。

[0012]

湿気硬化型樹脂は、例えば、コ ンクリート表面の水分および空 気中の水分と反応して硬化す る。コンクリートはポーラスな 構造をもち、そこに過剰の水分 が介在するとコンクリートと硬 化した樹脂の間に部分的あるい は全面的に水膜が残り十分な接 着強度が得られない。そこで本 発明のセメント含有樹脂組成物 では、この過剰の水分をセメン トに吸収させ、コンクリート表

urethane urea resin which has the urea bond inside the molecular structure is excellent in compared chemical-resistance moisture hardening type urethane resin of only a urethane bond, it is more preferable.

Especially, it is necessary to protect concrete from a hydrogen sulfide or various process chemical by lining construction with a water-

and-sewer-services facility.

It is necessary that it is the material which is excellent in chemical-resistance with adhesion.

[0010]

And, as for the moisture hardening type resin used by this invention, it is desirable that it is an liquid type moisture hardening type resin in respect of workability etc.

100111

In particular the cement used by this invention is not limited.

However, for example, a Portland cement, Portland blast furnace cement, a pozzolanic cement, and fly ash cement generally used to usual concrete work are mentioned, preferably, a Portland cement is used.

[0012]

A moisture hardening type resin, for example, reacts with the moisture content on the surface of concrete, and the moisture content in air, and is hardened.

If concrete has porous structure and a surplus moisture content interposes there, a water film layer will remain partially or extensively between concrete and the hardened resin, and sufficient bonding strength will not be obtained. Then, a cement is made to absorb this surplus moisture content in the cement-containing resin composition of this invention.

A concrete surface and sufficient bonding strength can be obtained.

面と十分な接着強度を得ること ができる。

[0013]

[0014]

本発明のセメント含有樹脂組成 やおよびパテ材は、コングエキ かの補修工事やライニングエキ の素地調整材として用とせが が、ほかに、として開せとが が、ほかに、タルとして使用するト がはかいとして使用するといる。 樹脂でき、次陥補をして好材としてが をしてが材としてが をしてがするといる。 が、あるに用いたが をいたがない。 ではいたがない。 ではいないが、 ではいないないが、 ではいないが、 では

[0015]

[0013]

In this invention, preferably as for the blend ratio of a moisture hardening type resin and a cement, 70 to 30 weight parts mixes a cement to 30 to 70 weight-parts of moisture hardening type resins, it can alter according to the surface moisture content of the concrete of construction object.

The mix ratio of a moisture hardening type resin and a cement is also further changeable with the film thickness in the case of using as for example, a putty material.

[0014]

The cement-containing resin composition and putty material of this invention are used as a surface-preparation material of the repair work of concrete, or lining construction.

However, besides a moisture hardening type resin and a cement, a micro aggregate can be added, it can also use as a resin mortar, and they are a surface-preparation material and the defect repair material of concrete, or it is suitably used as a surface-finish material.

[0015]

As for the film thickness of cement-containing resin composition and putty material of this invention, it is preferable to be referred to as 0.5 mm - 5 mm according to the degree of unevenness of the surface of construction object concrete.

Furthermore, it becomes easy about corrosion-protective-covering operation of the following process by performing a surface preparation by the putty material which has the thickness more than fixed, the lining construction which has sufficient bonding strength as a whole can be constructed promptly.

きる。

[0016]

また、本発明のセメント含有樹脂組成物およびパテ材は、ベラや金ゴテなどでセメントのをがでセメントのではように施工するとができ、コンクリートの表が10%以上の若材令のコンクリートや水洗直後のコンクリートにも高い接着力をす。

[0017]

[0018]

本発明のセメント含有樹脂組成物およびパテ材の湿潤接着性を生かして、劣化したコンクリートを高圧水で洗浄した直後にライニングに入る場合や、休業時間を長く取れない湿潤状態の場所で床工事を行う場合などに好適に用いられる。

[0019]

【実施例】

03/02/24

[0016]

Moreover, it can construct like a cement mortar by the rubber spatula, a metal trowel, etc., and the cement containing resin composition and putty material of this invention show high adhesive power also to the concrete of the short material age whose surface moisture content of concrete is 10 angstroms, or the concrete immediately after water wash.

[0017]

The cement-containing resin composition and putty material of this invention show the adhesion excellent in the concrete of wet condition, the defect on the surface of concrete is corrected as a surface-preparation material of the repair work of concrete, or lining construction, it is suitable to finish flat and smooth.

Moreover, if it finishes flat and smooth beforehand by this putty material also when performing coating and pouring exhibition construction to a concrete floor, the beautiful last finishing is realizable.

[0018]

The moist adhesion of the cement-containing resin composition of this invention and a putty material is used, when going into lining immediately after cleaning the concrete which deteriorated by high-pressure water, or when constructing a floor in the place of the wet condition which cannot take long closure time, it is used suitably.

[0019]

[Example]

The following Examples explain this invention in

以下の実施例によって本発明を more detail. さらに詳しく説明する。

[0020]

実施例1

JIS A5304により作製された市販のコンクリート歩間板を20℃の水中に24時間完全浸漬した後、上面より1cmを水を取って後、上面より1cmを水を取って、アグリートの表面水分率をモルタル表面水分率で割定した。このときのコンクリートの表面水分率は9%であった。

[0021]

次に一液湿気硬化型ウレタンウ レア樹脂34重量部とポルトラ ンドセメント66重量部を混合 してパテを作製した。このパテ を表面水分率が9%のコンクリ ート歩道板にコテで塗り付け、 20℃の室内で1週間養生し た。パテの膜厚は塗膜を切り取 ってマイクロメーターで測定 し、接着強度は建研式引張り試 験機で測定した。1週間後の膜 厚は、1.0mm、コンクリー ト歩道板との接着強度は、1. 78N/mm²で、コンクリー ト凝集破壊であり、下水道事業 団規格である1.2N/mm² を満足した。

[0022]

実施例2

コンクリート歩道板の表面水分率を14%以上にコントロールしたほかは実施例1と同様にして、パテの膜厚およびコンクリート歩道板との接着強度を測定

[0020]

Example 1

After 20 degrees-Celsius carries out the full immersion of the commercially available concrete foot-walk board produced by JIS A5304 to water for 24 hours, 1 cm is taken out on the water surface from a upper face, floating water was wiped off lightly and the surface moisture content of concrete was measured by mortar surface moisture content.

The surface moisture content of the concrete at this time was 9 %.

[0021]

Next, 66 weight-parts of Portland cements were mixed with 34 weight-parts of liquid moisture hardening type urethane urea resins, and putty was produced.

This putty was plastered by the iron to a concrete foot-walk sheet whose surface moisture content is 9 %, and it cured for one week in room interior of 20 degrees-Celsius.

The film thickness of putty cut off a coating film and measure it with micrometer calipers, bonding strength was measured by the Building Research Institute equation peel-test machine.

The film thickness after one week is 1.0 mm, the

The film thickness after one week is 1.0 mm, the bonding strength with a concrete foot-walk sheet is 1.78 N/mm2 and it is a concrete cohesive failure.

1.2 N/mm2 which is sewer-line corporation specification was satisfied.

[0022]

Example 2

The surface moisture content of a concrete foot-walk board was controlled to 14 angstroms, and also it is made to be the same as that of Example 1, when the film thickness of putty and bonding strength with a concrete foot-walk board are measured, film thickness is 1.0 mm,

したところ、膜厚は、1.0mm、コンクリート歩道板との接着強度は、2.59N/mm²で、コンクリート凝集破壊であり、下水道事業団規格である1.2N/mm²を満足した。このように、本発明によるパテ材に、本発明によるパテ材をコンクリートの表面水分率があった。で、なりで、な接着強度を示した。

the bonding strength with a concrete foot-walk sheet is 2.59 N/mm2, and it is a concrete cohesive failure.

1.2 N/mm2 which is sewer-line corporation specification was satisfied.

Thus, although the surface moisture content of concrete applied the putty material by this invention in the extremely high state, it showed sufficient bonding strength.

[0023]

実施例3

コンクリート歩道板表面の浮遊 水を拭き取らず、コンクリート 歩道板表面に0.3mm程度の 水が浮いているコンクリート供 試体を準備して被着体としたほ かは実施例1と同様にして、パ テの膜厚およびコンクリート歩 道板との接着強度を測定したと ころ、膜厚は、1.0mm、コ ンクリート歩道板との接着強度 は、1.52N/mm²であり、 界面剥離ではあったが、下水道 事業団規格である1.2N/m m² を満足した。このように、 本発明によるパテ材はコンクリ ートの表面に0.3mm程度の 水が浮いていても本発明のパテ 材は浮遊水を吸収し、十分な接 着強度を示した。また、1mm の塗布によりコンクリート表面 は完全に平滑とすることができ た。これにより、該パテ材の表 面にエポキシ系、ビニールエス テル系等の防食コーティングを 施工した場合、平滑な表面を得 ることができる。

[0023]

Example 3

The floating water of a concrete foot-walk sheet surface is not wiped off, a concrete specimen on which 0.3-mm level water floats is provided for a concrete foot-walk sheet surface.

It set as the adherent and also is made to be the same as that of Example 1, when film thickness of putty and bonding strength with a concrete foot-walk sheet are measured, film thickness is 1.0 mm and the bonding strength with a concrete foot-walk sheet is 1.52 N/mm2.

It was interfacial removal.

However, 1.2 N/mm2 which is sewer-line corporation specification was satisfied.

Thus, in the putty material by this invention, the putty material of this invention absorbs floating water even if 0.3-mm level water floats on the surface of concrete, and sufficient bonding strength was shown.

And, the concrete surface was able to be made completely smooth by 1 mm application.

Thereby, a flat surface can be obtained when anti-corrosion coating, such as an epoxy type and a vinyl ester type, is constructed on the surface of this putty material.

[0024]

Comparative Example 1

Surface moisture content of concrete is made into 8 %, only the liquid moisture hardening type urethane urea resin was applied to the concrete surface by the brush without mixing a Portland cement, and also it is made to be the same as that of Example 1, the film thickness of a coating film and bonding strength with a concrete foot-walk board were measured.

The bonding strength with 0.04 mm and a concrete foot-walk board of the film thickness at this time is 1.06 N/mm2.

1.2 N/mm2 which is sewer-line corporation specification was not satisfied, furthermore, it was interfacial removal.

[0025]

Comparative Example 2

Only the liquid moisture hardening type urethane urea resin was applied to the concrete surface by the brush, and also it is made to be the same as that of Example 2, the film thickness of a coating film and bonding strength with a concrete foot-walk board were measured. The bonding strength with 0.04 mm and a concrete foot-walk board of the film thickness at this time is 0.98 N/mm2.

1.2 N/mm2 which is sewer-line corporation specification was not satisfied, furtheremore, it was interfacial removal.

[0026]

Comparative Example 3

Only the liquid moisture hardening type urethane urea resin was applied to the concrete surface by the brush, and also it is made to be the same as that of Example 3, the film thickness of a coating film and bonding strength with a concrete foot-walk board were measured. The film thickness at this time was not adhered at all with 0.04 mm and a concrete foot-walk board.

Comparative Example 4

60 weight-parts of Portland cements are mixed with 40 weight-parts of 2 liquid reaction hardening type urethane urea resins, and it is made to be putty, it is applied to the concrete surface by the brush, and also is made to be the same as that of Example 2, the film thickness of a coating film and bonding strength with a concrete foot-walk board were measured.

The bonding strength with 1.0 mm and a concrete foot-walk board of the film thickness at this time is 0.71 N/mm2.

1.2 N/mm2 which is sewer-line corporation specification was not satisfied, furthermore, it was further interfacial removal.

[0028]

Comparative Example 5

60 weight-parts of Portland cements are mixed with 40 weight-parts of 2 liquid reaction hardening type urethane urea resins, and it is made to be putty, it is applied to the concrete surface by the brush, and also is made to be the same as that of Example 3, the film thickness of a coating film and bonding strength with a concrete foot-walk board were measured.

The film thickness at this time is 1.0 mm.

The swelling with a diameter of 5 - 30 mm occurred in the concrete foot-walk board whole surface.

The part without a swelling was partially adhered on the concrete foot-walk board.

However, it is a very weak coating film.

It was not what is borne practically.

[0029]

【発明の効果】

本発明では湿気硬化型樹脂がコンクリート表面および表層の水分と反応して硬化するとともに、これと混合されているセメントがコンクリート表面および表層の水分と反応して硬化するため、コンクリートの表面水分

Teflon, the disc of thickness 1 mm and diameter 50 mm was made, and it cured for one week in room interior of 20 degrees-Celsius.

This was completely immersed to 10% of sulfuric-acid liquid, and was left for one week. It removes from a sulfuric-acid liquid and washes in water, the surface moisture content was wiped off and the weight variation rate was measured.

The weight-increase rate at this time is 0.33 %. The chemical-resistance which was excellent to 10% of sulfuric-acid liquid was shown.

[0030]

Example 5

50 weight-parts of Portland cements are mixed with 50 weight-parts of liquid moisture hardening type urethane urea resins, and it is made to be putty, the weight variation rate was measured like Example 4.

The weight-increase rate at this time is 0.16 %. The chemical-resistance which was excellent to 10% of sulfuric-acid liquid was shown.

The weight-increase rate of the putty which used the liquid moisture hardening type urethane urea resin is small, and the putty which used the liquid moisture hardening type urethane resin shows superior chemical-resistance, it excelled in the capability to protect concrete from a corrosive environment.

[0031]

[EFFECT OF THE INVENTION]

While moisture hardened shape resin reacts with the moisture content of a concrete surface and surface layer and hardens in this invention, in order that the cement currently mixed with this may react with the moisture content of a concrete surface and surface layer and may harden, the surface moisture content of concrete shows high adhesive power also to the

クリートや水洗直後のコンクリ ートに対しても髙い接着力を示 す。

本発明のセメント含有樹脂組成 物およびパテ材は、湿潤状態の コンクリートに優れた接着性を 示し、コンクリートの補修工事 やライニング工事の素地調整材 としてコンクリート表面の欠陥 を修正し、平滑に仕上げるのに 好適であり、最終の美しい仕上 がりを実現することができ、湿 潤状態での床工事を行う場合な どに好適に用いられる。

[0032]

The cement-containing resin composition and putty material of this invention show the adhesion excellent in the concrete of wet condition, the defect on the surface of concrete is corrected as a surface-preparation material of concrete repair work or lining construction, it is suitable to finish flat and smooth.

The beautiful last finishing is realizable, and when performing floor construction by wet condition, it is used suitably.
